## ***Abstract***

*The development of China's roadway system is practically complete, and street maintenance is becoming increasingly important these days. A fundamental test for the majority of the street the board office is a logical and suitably procedure for the executives of the highway assistance. A logical administration requires a method for constructing a file arrangement of support the board. In light of the Shenzhen city construction project of a list framework for highway upkeep the board, the author of this paper proposes a method for constructing a file framework for highway upkeep the executives by presenting the executives' idea by objective, as well as incorporating key execution records into the file determination, and finally developing the file arrangement of upkeep the executives from five perspectives: security, quality, progress, cost, and condition assurance. By refining and selecting the record among the underlying results of determination using the rule of explicit, measurable, doable, substantial, and time-based, the essayist completes the file arrangement of highway upkeep executives that is appealing to the client.*

## **Introduction**

Construction results in the need for street maintenance. A proper street maintenance strategy not only extends the life of the street but also saves money on highway and scaffold maintenance. The maintenance of the board, like the creation and advancement, is a practical improvement. We shall pay growing attention to the highway maintenance board, despite the fact that the urgency and importance of maintenance executives are ignored by the street board division. Nowadays, the majority of the approaches for constructing the record framework are centred on construction ventures, highway natural framework, and ecological impact, among other things. By combining the recruiting and

reasoning techniques, Reference 1 creates a social effect post-evaluation of the motorway. Reference 2 presented a listframework technique for reasonable street construction assessment in China from the perspectives of society, economy, condition, construction quality, board framework, and strategies. The evaluation list for highway natural effect is organised in Reference 4. Reference 5 considers a record of the nature of the Florida State highway construction project. The vast majority of maintenance research is focused on administration planning, organisation, and innovation, despite the fact that there is still a significant gap in the highway maintenance board's file organisation. Maintenance executives' research is a perceptibly inquisitive inquiry into the degree of innovation and approach. Various maintenance the executives files and a comprehensive file framework for highway maintenance the board are essential in order to fully quantify the degree of highway maintenance the executives, identify faults in the maintenance the board, and make improvements as quickly as possible. A logical file framework can assess the highway maintenance board in a variety of ways and points, as well as take a comprehensive look at the situation. The essayist of this paper moves toward a method for construction of record arrangement of highway maintenance the board by presenting the executives' idea by goal and key execution list into the determination of the record in light of the Shenzhen city construction venture of list framework for highway maintenance the executives. Finally, the essayist develops the file framework from five perspectives: health, quality, progress, cost, and condition assurance, and completes the maintenance of the executives file framework that is acceptable to the client by refining and selecting the list frameworks among the underlying result of determination using the rule of explicit, quantifiable, achievable, significant, and time sensitive.

### **Management by objective (MBO)**

MBO is a modern management strategy that uses the goal as a guide, the human asset as a premise, and the results as a judgement to help the organisation or individual achieve the best results. In this method, each member sets a goal for themselves, starting at the bottom and working their way to the top, and ensures that the goals are met by a thoughtful individual. MBO was first applied to highway maintenance management, but

it was mostly used in the highway construction area. The MBO for highway maintenance mostly implies that the street maintenance division's overseeing level establishes a general goal for highway maintenance in a specific management time frame based on the genuine circumstances of the maintenance and societal requirements. The overall aim would be divided into the entire downstream management division on a level, forming a goal framework. The advancement of each individual office has a significant impact on their own evaluation. Any office or stage without a goal would be overlooked, raising the risk of waste and strife, especially as HR becomes increasingly connected. The highway maintenance management division will set a broad goal in a certain time frame, as specified by MBO, that will also meet state and industry requirements. All sub-offices and staff receive their sub-objective and work to achieve it by providing a few satisfactory assets emphatically to cause the general objective to be accomplished from that point forward, and the sub-objectives will be the standard of assessment and compensation for the sub-offices based on their contributions. The current list framework building strategy includes an examination technique and a multivariate factual strategy, both of which are irrelevant in the development of a highway maintenance management record arrangement.

### **Key performance indicator (KPI)**

KPI is a reflection and acknowledgment of the fundamental components in an organization's or association's planning process. Setting, testing, computing, investigating, and evaluating the important parameters from the information and yield of a given association might yield KPI. KPI stands for Key Performance Indicator, and it is a focused and analysed file that may be used to separate a project's critical goal into operational objectives and the standard of assessment for an organisation. The SMART (Specific, Measurable, Attainable, Realistic, Time-based) criterion must be followed while determining a KPI. KPIs highlight important aspects of highway maintenance management that the management division should pay greater attention to. By taking the target direction near the management office, the division should treat highway maintenance key execution as one of their primary tasks. For example, the management division is more concerned with the success of resolving client complaints, open

fulfilment, and administration confirmation, and accepts these three viewpoints as their primary execution lists, rather than all client concerns. By assessing those three significant exhibitions, the office would gain a sense of the highway use situation and fill in the gaps in their job.

## Conclusion

In light of the Shenzhen city highway maintenance management record framework construction venture, the essayist of this paper moves toward a method for building a file framework for highway maintenance management by presenting the idea of management by goal and key execution list into the choice of the record, and finally build the file arrangement of maintenance management from f. By refining and selecting the list among the underlying results of determination using the rule of explicit, quantifiable, notable, reasonable, and time constrained, the author completes the record arrangement of highway maintenance management that is neighbourly to the client.
